Installation of Expansion Bolts

1. According to the expansion bolt size, drill a hole in where you want to place the bolt;

2. Clean up remaining debris in the hole

3. Hit the expansion bolt with fixing item into the hole;

4. Tighten the nut using a wrench until the bolt expands.

PS:
If the wall is built by relatively soft brick, it may need to use the drill which is 1mm smaller than the suggested drill; Air brick, foam concrete block, autoclaved aerated concrete are not suitable for these expansion bolts.
