INSTRUCTIONS FOR MOUNTING YOUR GAMO AIR RIFLESCOPE

CAUTION: BE SURE THE AIR RIFLE IS NOT LOADED OR COCKED. PRACTICE SAFE AIR RIFLE HANDLING PROCEDURES AT ALL TIMES.

1. Attach lower half of ring mounts to base of rifle. The rear ring mount requires the installation of the recoil pin to prevent the rings from moving or slipping on the receiver grooves or rail. Lower the recoil pin down less than 1/4" into the ring perforation. In the event your scope mount does not have a recoil pin, you must install a scope stop.

2. Place scope onto the bottom half of the ring mounts.

3. Attach upper half of ring mounts. **DO NOT TIGHTEN SCREWS YET.**
To find the proper eye relief, move scope forward or rearward until you can see the reticle and target comfortably.

4. Tighten the horizontal screws in the lower half of the rings.
5. Before tightening the screws in the upper half of the rings, align (rotate) the vertical and horizontal posts axes of the reticle with the vertical and horizontal (bore) axes of the firearm. You can tighten all the ring mounts screws using a non permanent thread lock.
